# Automation: Setting the context

*What?*

*“Using machines to run machines”*

-- Peter F Drucker'1955

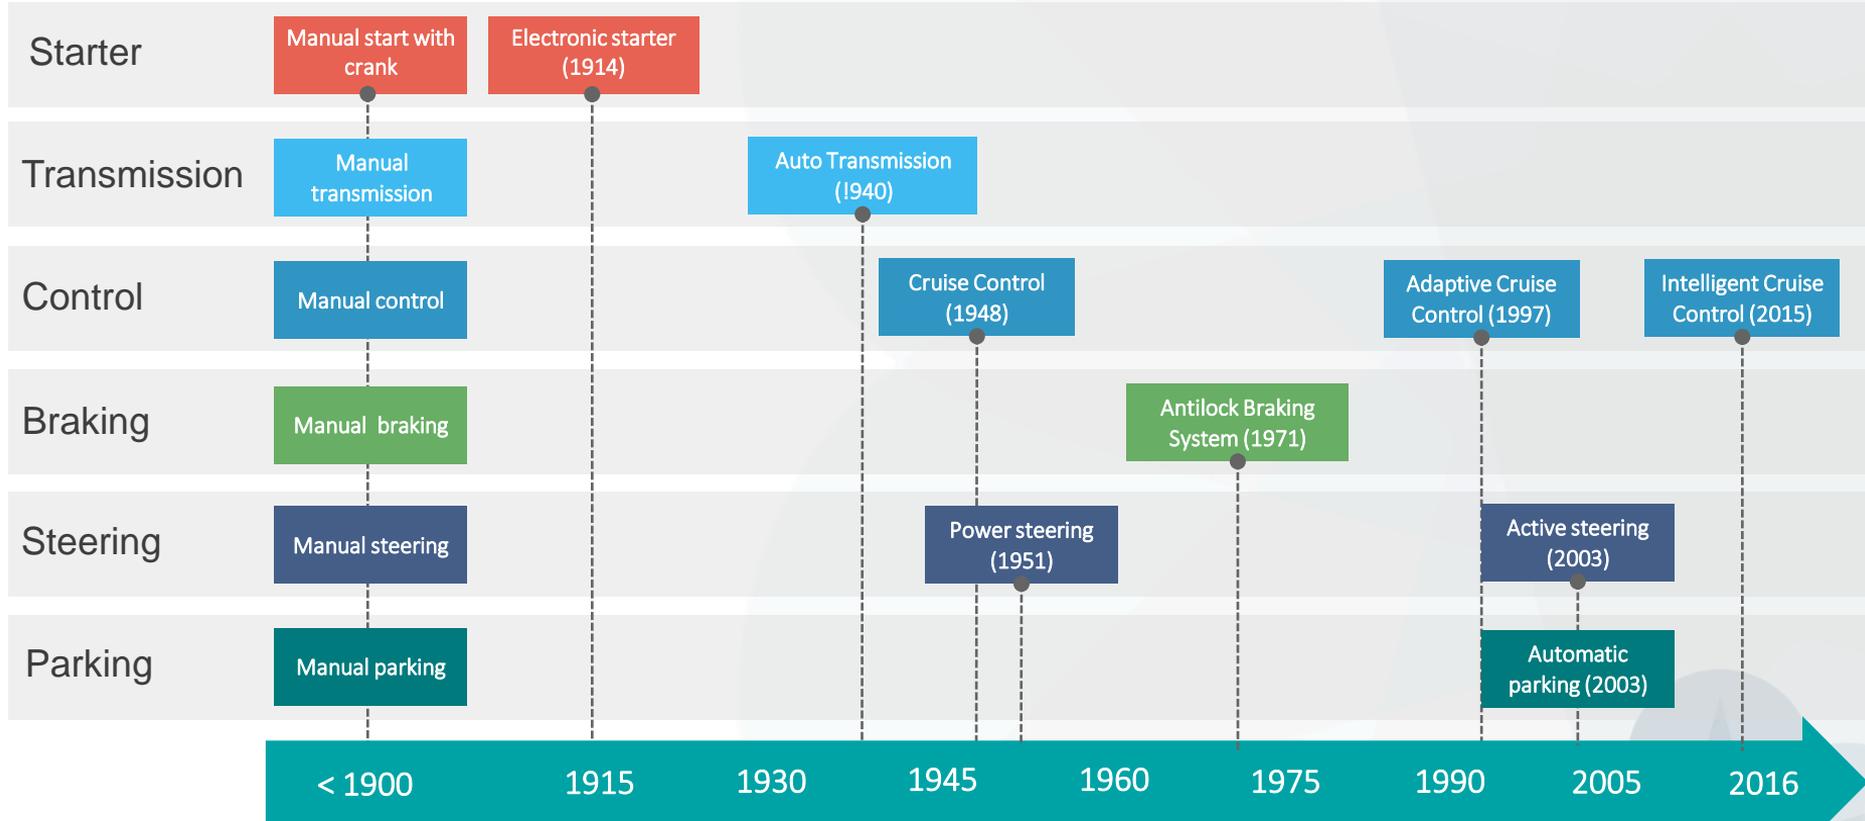

*Why?*

*Agility! Delivering outcomes @ speed*

*How?*

*Technology, Culture and Process*

# Evolution of the automobile

# Disruption of the automobile

Not just an incremental improvement, a disruptive change

## *The Self-Driving Car*

Is it a Car....Is it a Computer?

## The Promise

**Ownership:** Delineate ownership & usage. Uber++, ZipCar++

**Safety:** Human errors cause 94% of car crashes

**Planning:** No more traffic lights? Triple highway capacity?

**Logistics:** Self-driving trucks to revolutionize package delivery

## The Impact

**Don't need drivers:** Need programmers, operational folks

**Don't need cops:** Cars can (will) self-police

**Don't need witnesses:** Cars will be the most objective witnesses

**How does insurance work:** Who pays for the glitches?

# Unterwegs in der Taxi-Drohne

Autonom fliegende Lufttaxis sollen bald Menschen transportieren. Ein chinesisches und ein deutsches Unternehmen arbeiten an den Fluggeräten. Wer wird der Erste sein?

# Disruption of the Network

## Self-Driving Cars 'need' Self-Driving Networks

A self-driving network would

- Accept “*guidance*” from a network operator
- **Self**-discover its constituent parts
- **Self**-configure
- **Self**-monitor using probes and other techniques
- **Auto**-detect when a new service is needed and auto-enable it
- **Auto**matically monitor and update services to optimize service delivery
- Use machine learning for introspection (**self**-analysis)
- **Self**-report periodically or when an unexpected situation arises

*Self-Driving Networks: A vision worth pursuing*

The image features a dense, interconnected network of blue lines and nodes, resembling a globe or a data network. The nodes are small white circles, and the lines are thin blue lines connecting them. The network is set against a dark, starry background. The text "Automation @ scale" is overlaid on the left side of the image.

Automation @ scale

# WEB 2.0 COMPANIES

Reduce DC cooling bill by 40%

**2014:** Machine-learning algorithms used to predict Power Usage Effectiveness (PUE) of the datacenters with up to 99.6% accuracy

**2016:** Google DeepMind AI uses *historical data, telemetry & deep neural networks* to reduce Datacenter cooling bills by 40%

1 Engineer = 25,000 servers

**2011:** Facebook Auto Remediation (FBAR) to proactively detect and address production problems on *individual servers*.

**2016:** Automated Maintenance Handlers to safely automate maintenance on *multiple servers*. Dapper to co-ordinate both *automated and manual processes*

Helping developers sleep better

**2013:** Atlas, a sophisticated home-grown telemetry tool that collects up to *1.2 Billion data points per minute*

**2016:** Winston, outsources *repeatable diagnostics and remediation* tasks. Run automatically in response to events from Atlas

# LARGE ENTERPRISES

## Handling 10-fold traffic increase

Black Friday and Thanksgiving have a unique load profile

Simultaneous testing of all APIs using version-controlled test scripts

Historical data as an indicator of expected load

Capture meaningful metrics. Measure everything

## Predictive analytics for sales and service

Adopting Agile, DevOps and Lean principles to improve banking services

Big data analytics for pricing, fraud detection, predictive sales, customer retention

Determine the topic of a customer's call within 100 milliseconds, with 70 percent accuracy

Contributing to Open-source: Cloud-custodian, Hygieia

# TELCO PLAYERS

## Software-centric networking

ECOMP: Enhanced Control, Orchestration, Management and Policy platform

- AT&T's framework to adopt cloud and network virtualization technologies in carrier-scale, real-time workload environments.

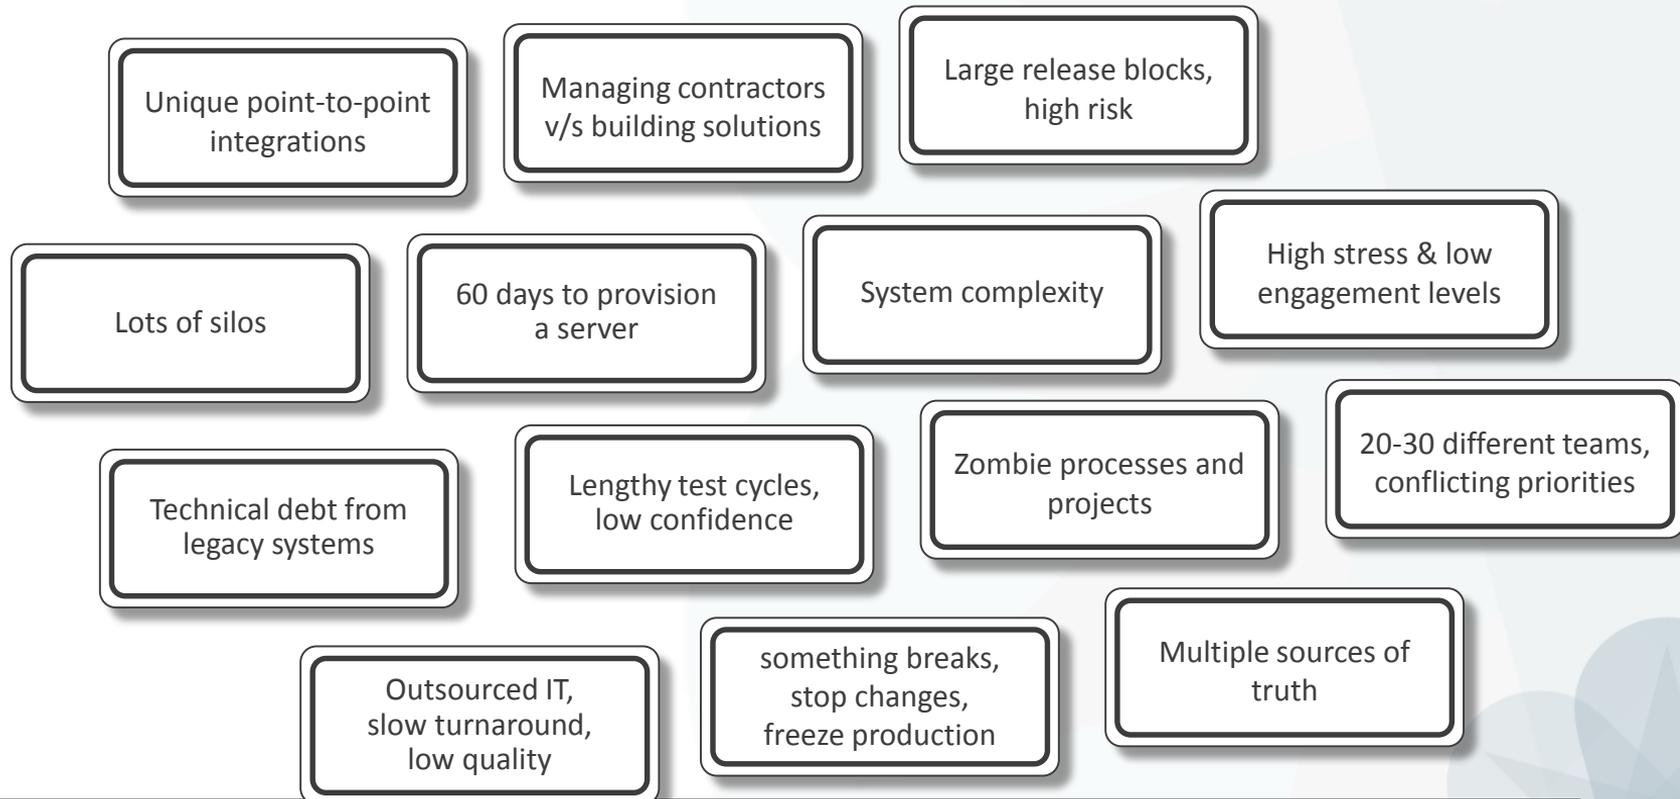

Focus areas:

- Design framework for uniform platform on-boarding using industry-standard initiatives
- Real-time, closed-loop automation of service/network/cloud delivery
- Data Collection, Analytics and Events correlation

Open-sourced for wider industry adoption and collaboration

# Charting the course for Automation

*Identify, acknowledge and target your roadblocks*

# Charting the course for Automation

*Identify, acknowledge and target your roadblocks*

## TECHNOLOGY

System complexity

60 days to provision  
a server

Unique point-to-point  
integrations

Technical debt from  
legacy systems

Multiple sources of  
truth

## CULTURE

High stress & low  
engagement levels

Lots of silos

20-30 different teams,  
conflicting priorities

Managing contractors  
v/s building solutions

## PROCESS

Outsourced IT,  
slow turnaround,  
low quality

Lengthy test cycles,  
low confidence

Zombie processes  
and projects

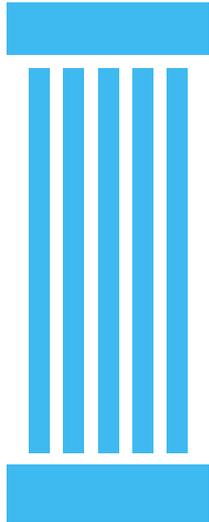

something breaks,  
stop changes,  
freeze production

Large release blocks,  
high risk

# Charting the course for Automation

*Find the right balance*

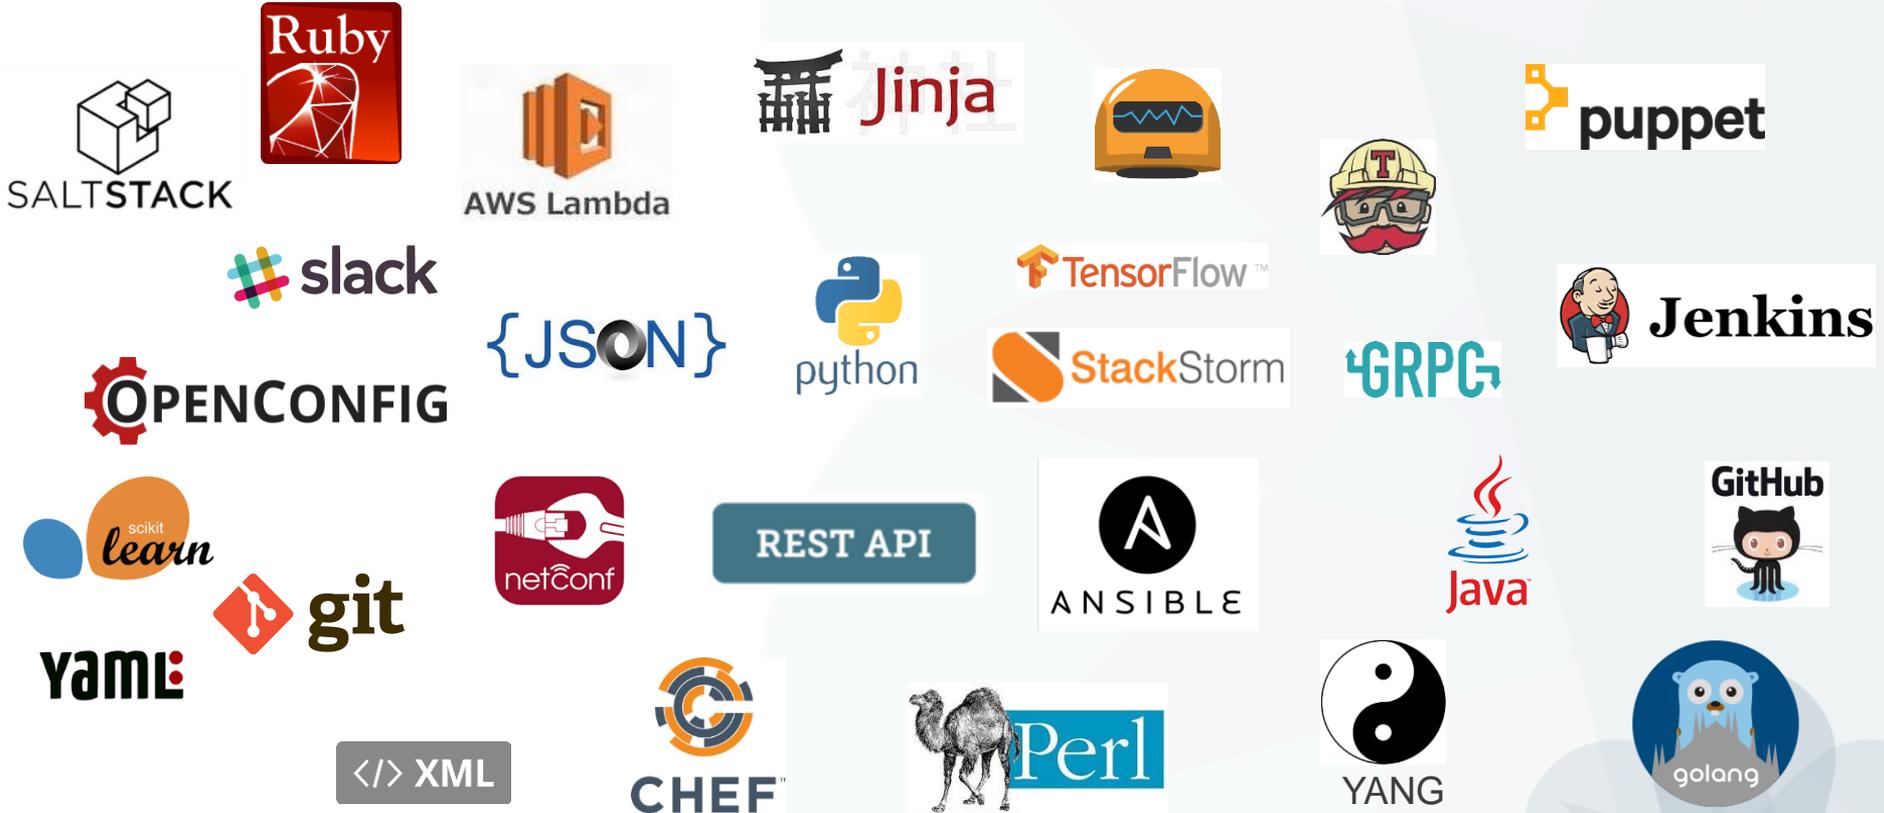

Technology: 'Leading the change'

# Network Automation: How do we get there?

Build an evolution path to fuel disruption

# Automation Technologies - Landscape

# Automation Technologies - Landscape

# Day 0 - Human-driven Automation

Day 0

Human-driven automation

Establish standard-based network interfaces and data models

Automate network provisioning & management

Simplify network operations

Standards-based network interfaces and data-models

Automate network provisioning & management

Simplify network operations

# Day 1 – Event-driven Automation

## Day 1

### Event-driven automation

Gather network information  
(Telemetry)

Use network information to  
make decisions

Rule-based action on  
network events  
(Closed loop automation)

### Gathering Network Telemetry

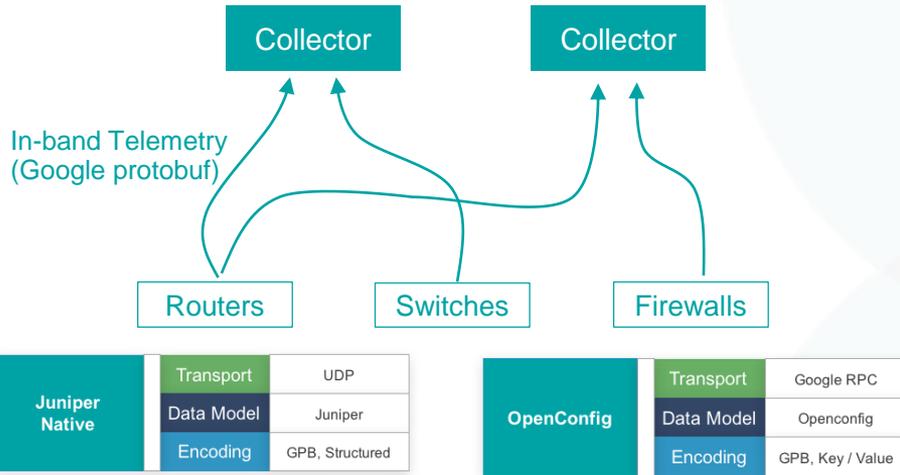

### Rule-based actions on network events

# Gathering Network Telemetry

What gets measured, gets managed

Goodbye SNMP, Hello gRPC

Juniper support

Supported on Juniper MX and PTX platforms JUNOS 15.1F3 onwards

## gRPC & JVision

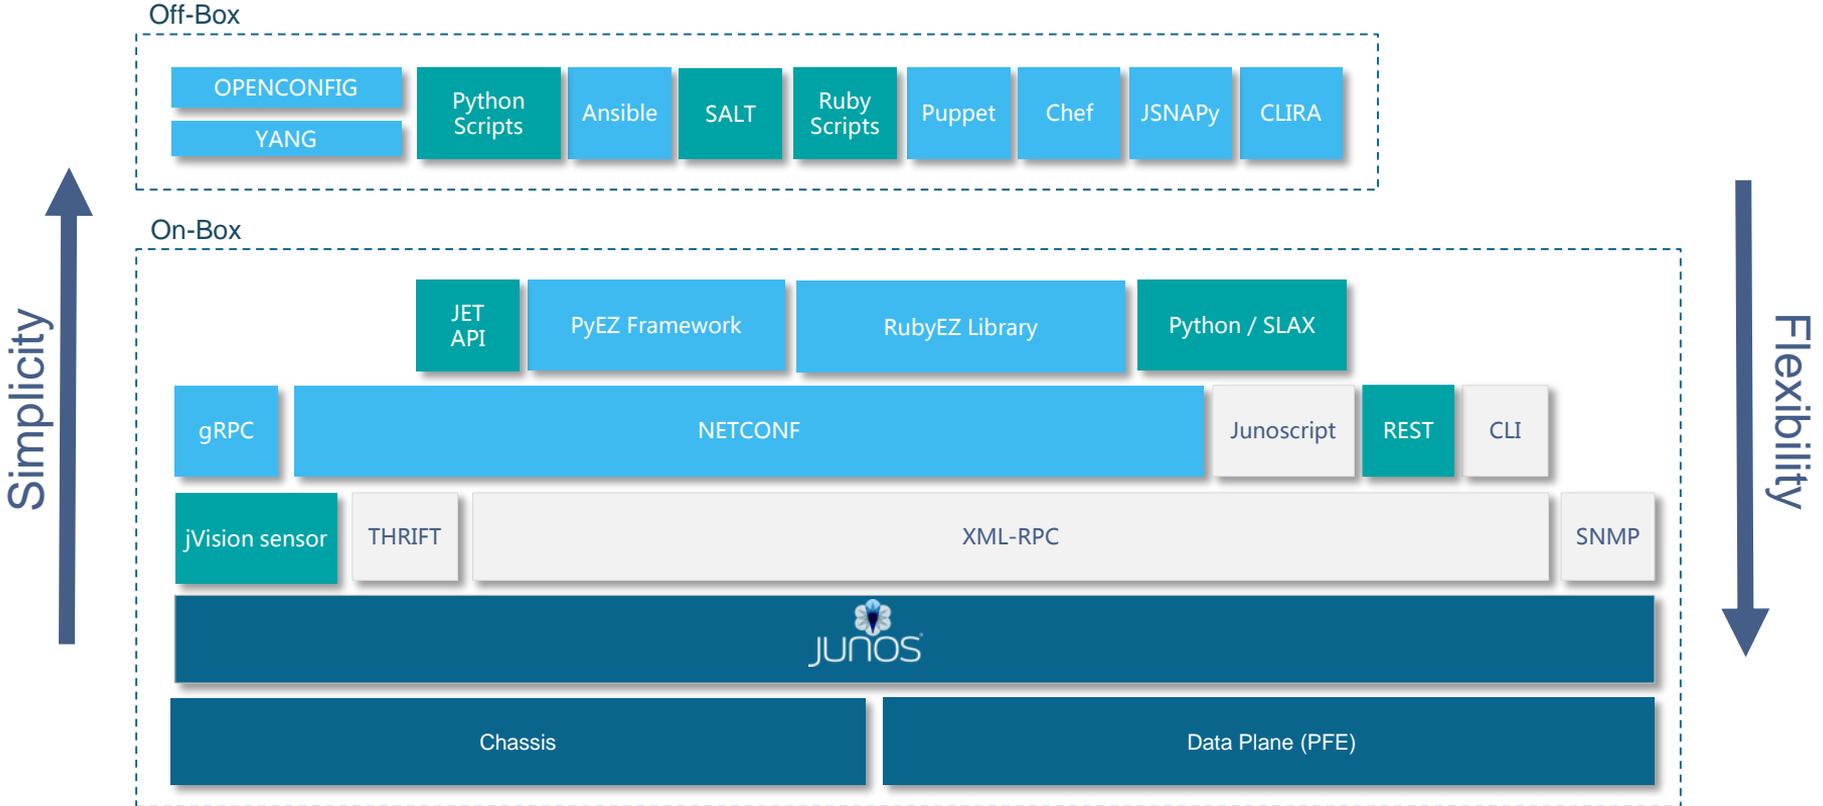

Push-based telemetry model (v/s pull-based SNMP)

Continuous streaming of Network telemetry data based on subscriptions

Observe network state through time-series data stream and take action.

Uses Google protocol buffer encoding format

# JUNOS AUTOMATION STACK

# Network Automation: Leading the pack

Third-party perspective on platform-vendor capabilities for Network Automation

**1** On-device APIs to read / write configuration and operational data

✓ **Juniper Networks: PASS**

**2** Structured operational data for easy programmatic analysis

✓ **Juniper Networks: PASS**

**3** Structured device configuration data for easy programmatic analysis

✓ **Juniper Networks: PASS**

**4** Atomic configuration changes to avoid partial updates

✓ **Juniper Networks: PASS**

**5** Configuration rollback to minimize risk

✓ **Juniper Networks: PASS**

**6** Full configuration replace that makes templates easy to use

✓ **Juniper Networks: PASS**

**7** Configuration difference analysis to simplify manual approvals

✓ **Juniper Networks: PASS**

**8** Industry standard data models for configurations

✓ **Juniper Networks: PASS**

# Juniper Openlab

*Accelerate Network and skills transformation*

## Technology Training

- Technology/Platform Training
- Automation, SDN, Others
- University Automation Throw downs

## Globally Accessible Software-Centric Lab

- Application Development
- Platform 'Sandboxes' for Exploratory and Educational Purposes
- Solution Demonstrations

OpenLab

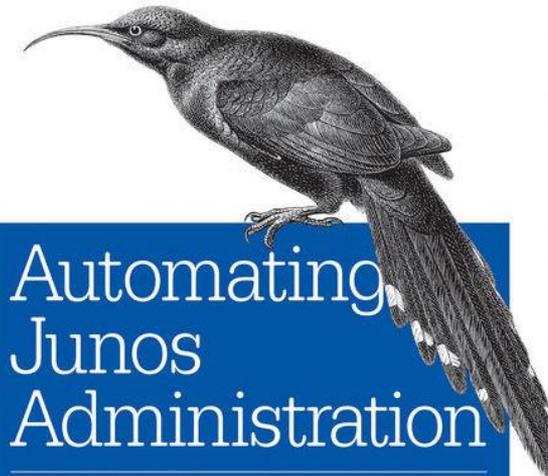

## Solution Incubation

- Assist in development of new SDN and network automation solutions
- Resources to build, test, and promote solutions that leverage Juniper's SDN and programmable networking assets

**7 global locations:** New Jersey, Sunnyvale (US), Amsterdam, London (EMEA), Singapore, Sydney, Tokyo (APAC)
